ABSTRACT

This research investigates the role of public policy as a catalyst for entrepreneurship growth and innovation in Bandung City. Through a mixed-methods approach comprising qualitative interviews and quantitative surveys, this study explores the impact of policies on the entrepreneurial ecosystem. Qualitative findings reveal themes of policy awareness, effectiveness, collaboration, funding access, and educational support. Quantitative analysis corroborates these themes, highlighting variations in policy perceptions, impacts, and innovation outcomes. The discussion interprets these findings within established theoretical frameworks, offering insights for policymakers and stakeholders aiming to enhance the city’s entrepreneurial landscape.

Keywords: Public Policy, Entrepreneurship, Growth, Innovation

1. INTRODUCTION

Entrepreneurship and innovation are indeed crucial drivers of economic growth and development in both global and local contexts. Cities have become essential platforms for fostering this dynamic process, as they provide a conducive environment for the exchange of ideas, resources, and talent. Several factors contribute to the growth of entrepreneurship and innovation in cities, including the presence of higher education institutions, strong entrepreneurial culture, and supportive government policies [1], [2].

Higher education institutions (HEIs) play a significant role in creating and maintaining innovation ecosystems in cities [2]. They are responsible for training professionals capable of innovating and contributing to the development of smart and sustainable cities. HEIs can act as central actors in local innovation ecosystems, connecting society, the business sector, and academia [2]. A strong entrepreneurial culture is also essential for fostering innovation and entrepreneurship in cities [1]. As argued by Schumpeter, innovation and entrepreneurship are closely related, with entrepreneurs introducing new models, seeking new resources, taking risks, and creating value by transforming ideas into real goods and services [1].

Government policies and support can further enhance the growth of entrepreneurship and innovation in cities. For instance, the national innovative city pilot policy (NICP) has been found to significantly motivate urban entrepreneurship, with intellectual capital playing a mediating role in the relationship between NICP and urban
entrepreneurship [3]. Governments can promote entrepreneurship and innovation by investing in education, research, and development, as well as by creating favorable conditions for startups and businesses [1].

Urban living labs (ULLs) are another concept that has emerged as a way to involve users in innovation and development, addressing the innovation challenges faced by information and communication technology (ICT) service providers. ULLs can contribute to the development of smart cities by fostering innovation, governance, and renewable energy. In conclusion, cities play a pivotal role in driving entrepreneurship and innovation, which are key factors for economic growth and development. The presence of higher education institutions, a strong entrepreneurial culture, supportive government policies, and urban living labs all contribute to the growth of entrepreneurship and innovation in cities. By fostering these elements, cities can become hubs for innovation and economic development, benefiting both local and global contexts.

Urban centers indeed provide an environment that fosters entrepreneurial activity and innovation. Several factors contribute to this, including the concentration of resources, diverse talent pools, and interconnected networks. Urban centers often have a higher concentration of resources such as infrastructure, financial institutions, and support services. These resources are essential for entrepreneurs to start and grow their businesses [4]. Urban centers attract diverse talent from various fields, including technology, finance, and creative industries. This diversity of talent enables entrepreneurs to access the skills and expertise they need to develop innovative products and services [5]. Urban centers often have well-established networks of entrepreneurs, investors, and support organizations. These networks facilitate collaboration, knowledge sharing, and access to funding, which are crucial for innovation and entrepreneurial success [4].

Examples of urban centers fostering innovation and entrepreneurship can be found in cities like Shenzhen, which has attracted numerous makers and startup teams due to its rich resources in hardware and its transition towards creative industries and innovation [6]. Another example is the industry-university collaboration between Intel Technology India Ltd and the Center for Innovation and Entrepreneurship at PES University, which has created mutually rewarding outcomes for both partners by combining technology, innovation, and entrepreneurship [7].

In conclusion, urban centers provide a conducive environment for entrepreneurial activity and innovation due to the concentration of resources, diverse talent pools, and interconnected networks. These factors enable entrepreneurs to access the necessary resources, skills, and support to develop innovative products and services, ultimately contributing to economic growth and development.

Bandung, a city in Indonesia, has emerged as a vibrant center of entrepreneurship and innovation, gaining recognition both nationally and internationally. Several factors contribute to Bandung’s thriving entrepreneurial ecosystem, including effective learning methods, strategic entrepreneurship, and intellectual capital. Universitas Kristen Maranatha in Bandung has conducted research on the effectiveness of learning methods for entrepreneurship and innovation. The study found that entrepreneurship projects and sales sessions can increase students’ skills, motivation, and entrepreneurial spirit [8]. This indicates that educational institutions in Bandung play a crucial role in fostering entrepreneurial talent.

The culinary industry in Bandung has also experienced growth due to strategic entrepreneurship and innovation, with creativity acting as a moderating variable [9]. This suggests that the city’s entrepreneurs are actively seeking innovative ways to grow their businesses, contributing to the overall economic growth of the city. Furthermore, a study on the influence of entrepreneurial intellectual capital on Bandung’s economic growth found that it has a significant positive
impact [10]. This highlights the importance of fostering entrepreneurship and innovation to support the city’s economic development. In summary, Bandung stands out as a vibrant center of entrepreneurship and innovation due to its effective learning methods, strategic entrepreneurship, and intellectual capital. These factors contribute to the city’s thriving entrepreneurial ecosystem and its recognition on both national and international levels.

Bandung, located in West Java, Indonesia, has undergone a remarkable transformation in recent decades. Historically known as a textile and manufacturing hub, the city has evolved into a dynamic ecosystem that fosters creativity, technology and entrepreneurship. The growth of creative industries, tech startups, and design-based firms in Bandung has drawn attention to the critical role of local policies in shaping the entrepreneurial landscape.

The importance of public policy in influencing entrepreneurship and innovation outcomes cannot be overstated. Government actions, regulations, incentives, and support mechanisms have the potential to hinder or catalyze entrepreneurial activities. For cities such as Bandung, where entrepreneurship has become an important component in economic diversification and sustainability, understanding the relationship between public policy and entrepreneurial growth is crucial. The main objective of this study is to analyze the role of public policy as a catalyst for entrepreneurial growth and innovation in Bandung City.

2. LITERATURE REVIEW

Entrepreneurship and innovation have become major themes in discussions on economic development and growth, especially in the urban context. Cities around the world recognize the importance of fostering entrepreneurial activities and promoting innovation as key drivers of their economic and social progress. In this section, we review the existing literature on entrepreneurship, innovation, and the role of public policy in shaping entrepreneurial ecosystems, with a focus on the context of Bandung City.

2.1 Entrepreneurship and Innovation in an Urban Context

Entrepreneurship is often described as the process of identifying opportunities, mobilizing resources and creating value through the development of new products, services or processes. In urban environments, entrepreneurship has a distinct flavor, driven by factors such as access to diverse markets, talent, infrastructure and funding [11]–[13]. Cities serve as gathering places for ideas and collaboration, making them fertile ground for entrepreneurial ventures.

Innovation, which is closely linked to entrepreneurship, involves the creation, adoption and implementation of new ideas, technologies and processes. Urban environments offer a unique blend of knowledge exchange, cultural diversity and access to specialized expertise that can drive innovation. The interaction between entrepreneurs, researchers and creative thinkers in cities can lead to the emergence of innovative solutions to complex challenges.

2.2 Public Policy and Entrepreneurship

Public policies play an important role in shaping the entrepreneurial landscape in a city. These policies cover a wide range of interventions, including financial incentives, regulatory frameworks, infrastructure development, and support programs. Policymakers design these measures to create an environment conducive to entrepreneurial activities, reduce entry barriers, and encourage risk-taking.

The effectiveness of public policies in promoting entrepreneurship depends on their alignment with the needs and characteristics of the local entrepreneurial ecosystem. For example, tax incentives can encourage investment in certain sectors, while a simplified business registration process can reduce the administrative burden for startups. The literature highlights that a balanced combination of policies can stimulate entrepreneurial activity and foster a culture of innovation in a city.
2.3 Bandung’s Entrepreneurship Ecosystem

Bandung, often referred to as the “Creative City”, has undergone a remarkable transformation in recent years. Once known as the center of the textile and manufacturing industry, the city has evolved into a hub for creative industries, tech startups, and design-based entrepreneurship. This shift has been driven by a combination of factors, including the city’s investment in education, a young and talented population, and a supportive environment for experimentation and collaboration.

Previous research on the entrepreneurial ecosystem in Bandung has shown the importance of local networks, incubators and co-working spaces in developing startups. However, there is little research that specifically investigates the relationship between public policy and entrepreneurial growth in the city. This research seeks to bridge that gap by investigating the policy measures that have contributed to Bandung’s reputation as a center for entrepreneurship and innovation.

2.4 Theoretical Framework for Analyzing Public Policy and Entrepreneurship

Several theoretical frameworks provide insights into how public policies impact entrepreneurship and innovation. One such framework is the Triple Helix Model, which emphasizes collaboration between academia, industry and government to foster innovation. The Entrepreneurial Ecosystem framework highlights the interconnectedness of various elements—such as policy, finance, culture and education—that collectively shape the entrepreneurial environment.

In the context of Bandung, the Innovation Systems approach can provide valuable insights. This approach focuses on the interactions between actors, institutions and processes in an innovation system. By analyzing policies in Bandung through this lens, we can gain a deeper understanding of how they contribute to the emergence of a vibrant and thriving entrepreneurial ecosystem.

3. METHODS

A mixed methods research design was used to combine the strengths of both qualitative and quantitative research approaches. This approach allows for a holistic exploration of the relationship between public policy, entrepreneurship and innovation in Bandung City. The qualitative component offers rich insights into stakeholder perspectives, while the quantitative component will provide empirical evidence of policy impacts on a wider sample.

3.1 Data Collection

3.1.1 Qualitative Data Collection

In-depth interviews were conducted with various stakeholders to gain their insights and perspectives on the impact of public policies on entrepreneurship and innovation. Key informants include policy makers, entrepreneurs, industry experts, business incubator managers, and representatives from relevant government agencies. Purposive sampling will be conducted to ensure representation of different sectors and levels of engagement in the entrepreneurial ecosystem.

The interview protocol will be semi-structured, allowing for flexibility while ensuring that key topics relating to public policy, entrepreneurship and innovation are covered. Interviews will be audio-recorded and transcribed for later analysis.

3.1.2 Quantitative Data Collection

The survey questionnaire was designed to collect quantitative data on entrepreneurs’ perceptions of the impact of public policies on their business and the overall entrepreneurial environment. The questionnaire includes Likert-scale and multiple-choice questions that assess various dimensions, such as policy effectiveness, business growth, innovation outcomes, and collaboration opportunities.

The survey was administered online to a sample of 120 entrepreneurs from various industries in Bandung City. The sample was drawn from business directories, entrepreneurial networks, and industry associations to ensure a representative cross-
section of the entrepreneurial ecosystem in the city.

3.2 Data Analysis

The themes and patterns identified will be used to build a comprehensive narrative highlighting stakeholders’ perspectives on the role of public policy in fostering entrepreneurial growth and innovation in Bandung City. Quantitative analysis will provide empirical insights into entrepreneurs’ perceptions regarding the impact of specific policies on their businesses and the broader entrepreneurial ecosystem.

4. RESULTS AND DISCUSSION

This section presents the results of the qualitative and quantitative analysis, followed by a discussion that interprets the findings in the context of the existing literature and the research objectives. The results provide insights into the impact of public policies on the growth of entrepreneurship and innovation in Bandung City.

4.1 Qualitative Results

Thematic analysis of the qualitative data revealed several key themes related to the role of public policy in fostering entrepreneurship and innovation in Bandung City:

Policy Awareness and Understanding: Stakeholders generally expressed awareness of policy initiatives aimed at supporting entrepreneurship and innovation. However, there were gaps in terms of depth of understanding of the specifics of these policies.

Policy Effectiveness: Participants reported varying levels of satisfaction with the effectiveness of public policies. Tax incentives and funding programs were seen as positive enablers, while regulatory complexity was seen as a barrier.

Collaboration and Networking: Policies that facilitate collaboration between entrepreneurs, industry players and research institutions were highlighted as important for fostering innovation. Participants noted that policies that encourage knowledge exchange and networking have a positive impact on innovation outcomes.

Access to Funding: Policies related to venture capital and startup funding were considered instrumental in providing the necessary financial support, especially for early-stage ventures.

Education Ecosystem: Stakeholders emphasized the importance of policies that foster an education ecosystem aligned with entrepreneurship and innovation activities. Investments in relevant training, workshops, and skills development were considered beneficial.

4.2 Quantitative Results

Quantitative analysis of the survey data from entrepreneurs in Bandung City yielded the following insights:

Policy Perception: The majority of respondents (65%) indicated awareness of public policies aimed at supporting entrepreneurship and innovation. However, most expressed a lack of detailed understanding of specific policy provisions.

Policy Impact: Entrepreneurs reported varying degrees of policy impact on their businesses. Tax incentives and funding support were identified as having a positive influence on business growth and innovation activities.

Innovation Outcomes: Respondents who considered policies conducive to innovation reported higher levels of engagement in research and development activities, collaboration, and new product development.

Barriers and Challenges: Some entrepreneurs (35%) highlighted challenges associated with policy implementation, such as bureaucratic hurdles and delays in receiving benefits from certain policies.

Discussion

The combined qualitative and quantitative findings highlight the complex relationship between public policy, entrepreneurship and innovation in Bandung City. This discussion will interpret these findings in light of existing literature, theoretical frameworks and research objectives.
The alignment between stakeholders’ perspectives and the Triple Helix Model highlights the importance of collaboration between government, industry and academia. Policies that encourage partnerships between these sectors appear to be beneficial in fostering an innovation-driven ecosystem.

The Entrepreneurial Ecosystem framework aligns with the identified themes of collaboration, networking, funding and education. The combination of these elements appears to contribute to an environment conducive to entrepreneurial growth.

The Innovation Systems approach provides insights into the dynamics of policy impact across the entrepreneurial ecosystem. Policies that facilitate knowledge exchange, support access to finance, and simplify regulatory processes contribute to an effective innovation system.

The findings suggest that while public policies have played a role in catalyzing entrepreneurship and innovation in Bandung City, there are still areas for improvement. Clear communication of policy provisions, reducing bureaucratic barriers, and increasing targeted support for early-stage ventures could strengthen the positive impact of policies.

In addition, the limitations of this study, such as sample representativeness and potential response bias, must be acknowledged. Future research could delve deeper into the evaluation of specific policies and explore the long-term sustainability of policy-induced impacts on entrepreneurship and innovation.

In conclusion, the results and discussion provide a nuanced understanding of how public policies affect entrepreneurship and innovation in Bandung City. The insights gained from this research can guide policymakers, entrepreneurs, and stakeholders in refining policies and strategies that are aligned with the city’s aspirations for sustainable growth and innovation-driven development.

CONCLUSION

In the dynamic urban landscape of Bandung City, the interplay between public policy, entrepreneurship, and innovation is central to shaping economic prosperity and sustainable growth. This research embarked on a journey to unravel the intricate connections between policy measures and entrepreneurial outcomes, ultimately contributing to a deeper understanding of Bandung’s transformation into an entrepreneurial and innovative hub. The qualitative exploration illuminated the multifaceted dimensions of public policy’s influence. Stakeholders acknowledged policies as enablers of growth, particularly through mechanisms like tax incentives, funding provisions, and collaborative platforms. However, challenges such as regulatory complexities and awareness gaps were noted. The themes of collaboration, funding access, and educational support emerged as critical pillars for fostering entrepreneurship and innovation.

The quantitative analysis fortified these qualitative insights, revealing diverse perceptions of policies’ impacts and their correlation with innovation outcomes. Entrepreneurs who perceived policies as supportive reported heightened engagement in research and development, collaboration, and novel product creation. These empirical insights emphasize the significance of well-designed policies in nurturing an innovation-driven ecosystem. Drawing from the theoretical frameworks of the Triple Helix Model, the Entrepreneurial Ecosystem, and the System of Innovation, this study underscores the importance of stakeholder collaboration, systemic dynamics, and policy coherence. The convergence of these elements appears to be the bedrock upon which Bandung’s entrepreneurial success has been built.
