Abstract

In response to escalating environmental concerns, sustainable product development has emerged as a pivotal strategy across industries. This paper presents a bibliometric review of eco-friendly innovation and market adoption within the realm of sustainable product development. The analysis spans from 1992 to 2024, synthesizing findings from 980 scholarly publications. Key themes, influential contributors, and temporal trends are identified through citation analysis, co-citation analysis, and bibliographic coupling techniques. The results underscore the significant impact of research in this field, with notable contributions addressing bio-composites, green IT, consumer behavior, and corporate sustainability. Visualizations elucidate evolving research clusters, from foundational topics to emerging areas such as circular economy and eco-innovation. Future research directions include eco-friendly materials, green product innovation, circular economy integration, sustainable product design, and supply chain implementation. This study provides valuable insights for academia, industry, and policymakers to advance environmental sustainability and socio-economic development.

Bibliometric Analysis

1. INTRODUCTION

In recent decades, the global community has witnessed an increasing urgency to address environmental concerns and strive for sustainability across various sectors [1], [2]. As industries grapple with the imperative to minimize their ecological footprint, sustainable product development emerges as a pivotal strategy in achieving environmental goals while meeting consumer demands [3], [4], [5]. This research endeavors to delve into the evolution of sustainable product development studies, focusing on the bibliometric analysis of eco-friendly innovation and market adoption.

The escalating environmental degradation and the pressing need for sustainable solutions have prompted both academia and industry to intensify their efforts towards eco-friendly practices [6], [7]. Sustainable product development,
characterized by the integration of environmental considerations into the product lifecycle, represents a fundamental approach in this endeavor [8], [9]. Over the years, numerous studies have explored various facets of sustainable product development, encompassing innovation, design, manufacturing, marketing, and consumer behavior [10]. However, despite the proliferation of research in this domain, a comprehensive understanding of its evolution, trends, and key contributors remains elusive.

Amidst the burgeoning interest in sustainable product development, the landscape of research in this field is characterized by its breadth and diversity. Consequently, there exists a need to systematically analyze the literature to identify prominent themes, emerging trends, and gaps in knowledge. Moreover, understanding the trajectory of research in eco-friendly innovation and market adoption is crucial for informing future endeavors and policy interventions. Thus, the primary research problem addressed in this study revolves around deciphering the evolution of sustainable product development studies and elucidating the factors influencing eco-friendly innovation and market adoption. This paper aims to:

1. Conduct a comprehensive bibliometric review of scholarly publications pertaining to sustainable product development, focusing on eco-friendly innovation and market adoption.
2. Identify key themes, research clusters, and influential contributors within the literature on sustainable product development.
3. Analyze the temporal evolution of research trends and the dynamics of knowledge dissemination in the field.
4. Analyze the potential research topics for further investigation in this field.

This research holds significant implications for academia, industry, and policymakers alike. By synthesizing existing knowledge and identifying research gaps, it provides valuable insights to scholars seeking to advance the discourse on sustainable product development. Moreover, industry practitioners stand to benefit from a nuanced understanding of consumer preferences, market dynamics, and strategies for fostering eco-friendly innovation. Furthermore, policymakers can leverage the findings of this study to formulate evidence-based policies and regulations that promote sustainability across sectors, thereby contributing to the broader goal of environmental conservation and socio-economic progress.

2. LITERATURE REVIEW

Sustainable product development studies have evolved over time to incorporate various aspects of sustainability. The process of product development now includes considerations for materials, manufacturing processes, and the product life cycle [11]. There is a growing focus on the circular economy, with an emphasis on remanufacturing, recyclability, and end-of-life design [12]. Accessibility and inclusivity have also become important factors in product development, particularly in the tourism industry [13]. The development of sustainable products involves collaboration among stakeholders and the integration of sustainable tourism principles [14]. Mathematical models are being used to determine the cost of designing sustainable products, enabling early cost estimation [15]. Corporate sustainability has shifted from being an altruistic option to a source of revenue, leading to transformations in strategy and practices. Overall, sustainable product development studies have expanded to encompass environmental conservation, social sustainability, and economic sustainability.

3. METHODS

This study employs a bibliometric approach to systematically analyze the literature on sustainable product development, with a specific focus on eco-
friendly innovation and market adoption. The data collection process involves retrieving scholarly publications from reputable databases such as Web of Science, Scopus, and Google Scholar, using a comprehensive set of keywords and search queries tailored to the research domain. The inclusion criteria encompass peer-reviewed articles, conference proceedings, and book chapters published between a specified timeframe (1992-2024), ensuring a representative sample of relevant literature. Following the data collection phase, bibliometric analysis techniques, including citation analysis, co-citation analysis, and bibliographic coupling, will be utilized to identify key themes, research clusters, and influential authors within the dataset. Additionally, temporal analysis techniques will be employed to examine the evolution of research trends over time. The findings of this study will be interpreted and discussed in the context of existing literature, providing insights into the trajectory of sustainable product development research and its implications for eco-friendly innovation and market adoption.

4. RESULTS AND DISCUSSION

Table 1 presents key bibliometric metrics derived from the analysis of scholarly publications in the field of sustainable product development from 1992 to 2024. The dataset comprises 980 papers with a total of 93,449 citations, resulting in an average of approximately 95.36 citations per paper. The analysis reveals a remarkable rate of citation accumulation, averaging 2,920.28 citations per year. The prolificacy of authors in this field is evident, with an average of 450.36 papers per author and an astonishing 43,675.92 citations per author. The collaborative nature of research is reflected in an authorship ratio of 2.80 authors per paper. Notably, the h-index, a measure of both productivity and citation impact, stands at 152, indicating a substantial influence of the publications in the dataset. The g-index, a variant of the h-index, is calculated at 276, further emphasizing the impact of the research output. Additionally, the table provides insights into the citation distribution, indicating the number of papers with citations exceeding various thresholds (1, 2, 5, 10, and 20), with the majority of papers surpassing each threshold. Overall, these metrics underscore the significance and impact of research in sustainable product development, highlighting its scholarly relevance and influence over the past three decades.
Table 2 presents the top cited research articles in the field of sustainable product development, showcasing the influential contributions that have significantly shaped discourse and practice within the domain. Topping the list is the work by AK Mohanty, M Misra, and LT Drzal in 2002, which discusses the opportunities and challenges in the development of sustainable bio-composites from renewable resources. Following closely is P Shrivastava’s 1995 paper on environmental technologies and competitive advantage, highlighting the intersection of environmental sustainability and business strategy. S Murugesan’s 2008 study on harnessing green IT principles and practices ranks third, underscoring the importance of information technology in environmental sustainability efforts. Other notable contributions include research on consumer attitudes and behavior towards green practices in the lodging industry by K Manaktola and V Jauhari in 2007, as well as studies investigating the determinants of green purchase behavior by R Yadav and GS Pathak in 2016 and 2017. Furthermore, H Han, LTJ Hsu, and JS Lee’s empirical investigation on the roles of attitudes, overall image, gender, and age in consumers’ eco-friendly decision-making process, and YJ Kim et al.’s examination of the effect of green human resource management on employees’ eco-friendly behavior and environmental performance, signify the multifaceted aspects of sustainable product development. Additionally, K Govindan et al.’s 2014 study on barriers to green supply chain management implementation in Indian industries sheds light on challenges and opportunities in sustainability practices within the supply chain. Together, these top cited research articles represent pivotal contributions that have advanced understanding and practice in sustainable product development and environmental sustainability.
This image is a visualization of a network analysis, representing the co-occurrence or correlation of various terms related to "green marketing," "consumer," "industry," and "product design," which is the central topic in this field. Here's a breakdown of the clusterization observed:

1. **Green Marketing Cluster:** This is indicated by the large node labeled "green marketing" and includes related terms like "green marketing strategy," "marketing," "market," and "green marketing practice." It seems to be connected strongly to terms about consumer behavior and industry practices, suggesting a focus on marketing efforts within eco-friendly contexts.

2. **Consumer Cluster:** It is represented with a purple color and includes terms like "consumer," "value," "purchase intention," "green purchase intention," and "empirical study." This suggests a focus on consumer behavior, values, and the factors that influence the intention to purchase green products.

3. **Industry Cluster:** This cluster is represented by nodes such as "industry," "product design," "manufacturing," "supply chain," and "eco-friendly practice." It likely focuses on the application of green principles in industrial design, manufacturing processes, and the supply chain.

4. **Product Design Cluster:** This cluster is closely related to the industry cluster but seems to specifically involve terms related to the design aspect of products, such as "product design," "eco-friendly material," "sustainable product design," "eco-innovation," and "eco-friendly packaging."

5. **Hotel Sub-cluster:** Within the green industry practices, there's a sub-cluster focused on the hotel industry, with terms like "green hotel," "eco-friendly hotel," "hotel," and "hospitality industry," which suggests a specific focus on green practices within hospitality.
This figure is an overlay visualization, which is displaying a network of terms and their relationships over time. The color gradient from blue to yellow typically indicates the timeline of the research trends, with blue representing earlier years and yellow indicating more recent years.

1. Early Trends (Blue Areas): These are likely the areas of research that were more prevalent in earlier years, around 2016. Several terms can be identified in this area such as green marketing, consumer, sustainable product design, green practice, and sustainable product development.

2. Developing Trends (Green Areas): The green areas could indicate topics that have been steadily researched over the years, acting as ongoing areas of interest. This might include broader topics such as "industry," "product design," and "manufacturing," which are essential components of green marketing but also part of general industry practices.

3. Recent Trends (Yellow Areas): The yellow areas represent the most recent trends in the research, closer to 2020. It appears that recent research might have focused on specific applications of green practices such as "circular economy," "eco-friendly packaging," and aspects specific to the "hotel" industry. There's also the presence of "eco-innovation" in product design which could indicate a more recent emphasis on innovative practices in sustainability.
In this VOSviewer visualization, the less bright areas could represent the less frequently discussed or emerging topics within the dataset, which could become more prominent in the future. Furthermore, several future research directions can be identified as follow:

1. Eco-friendly Material: This term is not as brightly highlighted, which might indicate that while it's present in the research, it's not as central as other terms. Future research could focus on the development, use, and consumer perception of eco-friendly materials.

2. Green Product Innovation: Located towards the edge and not very bright, suggesting there is room for growth in research focused on innovation in green product development.

3. Circular Economy: While it's a term with existing significance, its position and brightness suggest that there is substantial scope for additional research, especially into how circular economy principles can be integrated into various industries.

4. Eco Innovation: Appears as an emerging topic that could be explored more deeply, especially in the context of product design and manufacturing processes.

5. Sustainable Product Design: Its placement indicates a developed interest, but the relative dimness suggests further potential, possibly in specific sectors or in relation to new sustainable materials and technologies.

6. Supply Chain Implementation: This might refer to the application of green practices throughout the supply chain, indicating a possible avenue for research on effective implementation strategies.

These areas are not as central or as frequently mentioned as concepts like "green marketing" or "consumer," but they are connected to the main clusters, indicating
their relevance and potential for growth in future research.

5. CONCLUSION

In conclusion, the comprehensive bibliometric review of sustainable product development studies, focusing on eco-friendly innovation and market adoption, has shed light on the evolution, trends, and key contributors within this field. The analysis revealed a robust body of literature spanning three decades, reflecting the increasing scholarly interest and societal importance of sustainability. Noteworthy findings include the remarkable rate of citation accumulation, indicative of the profound impact of research in this domain. Key themes such as green marketing, consumer behavior, industry practices, and product design emerged prominently, underscoring the multidimensional nature of sustainable product development. Furthermore, the visualization of research trends over time highlighted evolving areas of interest, from foundational topics to emerging concepts such as circular economy and eco-innovation. Identified future research directions encompass eco-friendly materials, green product innovation, circular economy integration, sustainable product design, and supply chain implementation, indicating ongoing avenues for scholarly inquiry and practical application. Overall, this study contributes to a deeper understanding of sustainable product development and offers valuable insights for academia, industry, and policymakers to advance environmental conservation and socio-economic progress.
